| <p>I reviewed the relevant documentation but it's very possible that I missed this. Is it possible to create a different menu for each page? Basically, what I would like to do is to have the overall menu in the left side bar for my home page show categories of pages and then when the categories of the pages are clicked, a new page will show another menu of articles for that category.</p> <p>For example, the main page will have an "applications/admissions" category. When the user clicks on that item, they are then brought to another page with another menu that shows articles about application data, etc.</p> |                   |                        |            |

Hi Michael,

You might want try the "Widget Context" plugin to manage how certain widgets are displayed based on conditions that you specify.

Here's a screenshot of what it looks like when it is active:
